Installation guide for single faced units

- Varia M80h-P4
- Varia M100h-P4

1. Dismantling

WARNING
BEFORE MOVING AND PLACING THE FIREPLACE DISMANTLE THE UNIT. IMPROPER DISMANTLING CAN CAUSE PROPERTY DAMAGE! DO NOT MOVE THE UNIT WITH ASSEMBLED MANTLE.

THE UNIT IS DELIVERED WITH INSTALLED ZERO CLEARANCE MANTEL.
Step 1 – Dismantle the top module (1)

Loosen the 4 tapping screws at the left side, the 4 at the right side and the 10 at the back side (pic. 1). Remove the top module. It is marked by a sticker number “1” (see pic. 2).
Step 2 – Dismantle the back modules (2+3)

Loosen the 2 connecting plates fixed by 8 tapping screws. Loosen the mantel guideway fixed by 4 tapping screws. Loosen the 4 tapping screws at the left side, the 4 at the right side and the 4 at the bottom (pic. 3). Remove the 2 back modules. They are marked by stickers number “2” and “3” (see pic. 4).
Step 3 – Dismantle the front plate (4)
Loosen the 9 tapping screws.
Remove the front plate. It is marked by a sticker number “4” (see pic. 5).

Step 4 – Dismantle the side modules (5+6)
Loosen the 4 tapping screws at the left side.
Remove the left side module. It is marked by a sticker number “5” (see pic. 6).
Loosen the 4 tapping screws at the right side.
Remove the right side module. It is marked by a sticker number “6” (see pic. 7).
2. Moving the unit

To move the unit take the 4 provided carry handles and fix them at the 2 threaded holes on each side of the unit (see pic. 12-13):
1. Move the unit of the floor panel.
2. Position the floor panel in the installations final position.
3. Move the unit onto the floor panel. The position rings on the floor panel show the right position for the feet (see pic. 18).
3. Unlock transportation lock

Once the fireplace has been dismantled unlock the counterweights using a screw-wrench size 13 (see pic. 8-12). Remember to perform this operation before inserting the fireplace into the enclosure.

Picture 23
4. Move the door

After unlocking the transportation lock you can open and close the door by using the operational tool and putting it on the lever at the units right side (see pic. 25-29).
5. Reinstall the zero clearance mantel

Reinstall the Zero Clearance Mantel. Screw the parts as described in chapter 1 “Dismantling” in the reversed numerical order:

1. Install the module, side wall right (6).
2. Install the module, side wall left (5).
3. Install the front plate (4).
4. Install the module, back wall left (3).
5. Install the module, back wall right (2).
6. Fix the guideway and the 2 connecting plates.
7. Install the top module (1).

6. Connection of separate combustion air

When operating with an open fire, the Varia M consumes a large amount of air. Therefore, we recommend providing an external air supply, although this is not mandatory.

There are three openings Ø 7” at the bottom of the zero clearance mantel. At one of them you can connect separate combustion air, the other two will provide convection air (see pic. 19).

There are two possibilities to connect separate combustion air:

1. **Connection to the zero clearance mantel**
   
   To connect the separate combustion air to the zero clearance mantel screw the connection adapter Ø 6”, which is enclosed to the unit. You can connect it to the left side, right side or to the back by loosening the 4 tapping screws and fixing the adapter with them (see pic. 20-22).
2. Connection directly to the unit

To connect the separate combustion air directly to the unit you need to have the separate combustion air connector Ø 6" (A # 1018173). Fix the connector directly to the unit. It can be oriented to the left side, right side or to the back. (see pic. 23-25).
**Fresh air ducts**

The ducts providing the outside combustion air should be as short as possible to prevent pressure loss and to prevent making the house cold.

**Grills**

The combustion air ducts will be protected at the outside by a grill. The free passage section of those grills is at least equivalent to the section of the air inlet. Please note that the infiltration of water and the effect of the wind can damage the system.

**Closure valve**

If you decide to connect separate combustion air it is mandatory to install a closure valve to prevent condensate formation and to prevent the room from becoming cold while the stove is not in use. It should ideally be located as close as possible to the outside wall. It can be controlled from inside if it is not too far from the stove (see pic. 26)
Picture 38: connection from the outside to the zcm with installation of a closure valve

Picture 39: connection from the outside directly to the unit with installation of a closure valve
**WARNING**

IF YOU CONNECT THE SEPARATE COMBUSTION AIR DIRECTLY TO THE UNIT THE CLOSURE VALVE HAS TO BE OPEN WHILE BURNING. ONLY CLOSE THE VALVE WHEN THE FIREPLACE IS NOT IN USE. INOBSERVANCE MAY CAUSE THE FIRE TO BE EXTINGUISHED BECAUSE OF NO PROVISION OF COMBUSTION AIR.

**Options**

Instead of bringing the combustion air directly from the outside you can connect the duct to another room which is provided with fresh air. In that case it is not mandatory to install a closure valve.

If it is not possible to bring in outside air near the stove (most unfavourable case) the necessary air for combustion will be taken from the room. In that case make sure the air renewal is sufficient when the fireplace is in function e.g. by opening windows in the room. In this case it is not mandatory to install a closure valve (see pic. 29-30).

![Diagram](attachment:diagram.png)

Air extraction systems

Please note

Be careful with air extraction systems (kitchen hoods, air conditioning, mechanically-controlled ventilation, other stoves) in operation in the same space or in an adjacent room. They also use lots of air and can cause a depression in the room and prevent the stove from operating correctly (risk of draughtback). They can affect the operation of the stove even if it is connected to an outside air inlet.

The connection of fresh air is crucial for homes that are highly energy efficient.
